

ELVIS VIEWER DIRECT

INCREASE OF COMFORT AND SECURITY OF YOUR HOME WITH ELVIS VIEWER DIRECT

The Elvis Viewer direct is a terminal for your home that is installed as app on mobile devices with Android or the Apple operating system iOS.

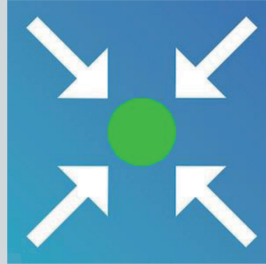

Simple switching operations, such as switching lights on/off or operating roller blinds, can be implemented just as easily as triggering scenes and sequences or starting time programs. The Elvis Viewer direct informs you if a window or a door has been opened, no matter where you are in the world.

There are numerous other examples that will make the control of your home more comfortable and safer. If you set up a secure VPN-connection, all operating functions are also available on your smartphone when you are on the move.

No communication has to be handled via any cloud server! Your project can be extended at any time. The setup of additional functions, for example Elvis Viewer direct as intercom for a door station, is also possible at a later date.

The standard interfaces KNX and MQTT are supported for the connection of the building services to be operated and controlled. There are numerous components for both standards: switches, dimmers, roller blind controls, sensors for temperature and humidity, window and door contacts and much more. For the notification of events via SMS or voice message, appropriate access to the mobile network or to a VoIP provider may be required.

The purchase of Elvis Viewer direct for about 70 EUR includes the use of Elvis Designer a great tool for creating your Elvis Viewer direct project. You can get the Elvis Designer from our download area (www.it-gmbh.de).

With our training offer a fast, extensive and smooth start into the project engineering of the Elvis system is guaranteed. Please contact us!

ELVIS VIEWER AND ELVIS VIEWER DIRECT

The Elvis Viewer is also a control station for mobile devices. But it additionally needs the Elvis Server, which must be installed on a Windows operating system in the facility. So, all interfaces and automation are available to Elvis Viewer which are supported by Elvis Server.

The Elvis Server has powerful automation modules for energy management, shadowing and the implementation of complex logical processes.

The target of the Elvis Viewer is therefore the use in functional buildings and private buildings

with numerous interfaces and complex Processing logic. The Elvis Viewer direct on the other hand aims at smaller installations as often desired for bistros, apartments or mobile homes. You save the installation and operation of a server, a simple, standard tablet is all you need.

If you ever find that you need the additional functionality offered by Elvis Server, based on the current state of your project planning, a seamless handover to an operation with Elvis Server is always possible.
